

## 1 General Notations

- $N$ : Number of users
- $n$ : Number of items,  $n = \begin{cases} 2m - 1, & \text{if } n \text{ is odd} \\ 2m, & \text{otherwise} \end{cases}$
- $\mathcal{P}_n$ : the space of permutation of  $n$  items
- $\mathbf{R}^1, \dots, \mathbf{R}^N$ : full rankings given by the users
- $\mathbf{R}^j \in \mathcal{P}_n = \{R_1^j, \dots, R_n^j\} \sim \text{Mallows}(\boldsymbol{\rho}^0, \alpha^0)$ , defined as  $P(\mathbf{R}^j | \alpha^0, \boldsymbol{\rho}^0) = \frac{\exp\{-\frac{\alpha^0}{n} d(\mathbf{R}^j, \boldsymbol{\rho}^0)\}}{\sum_{\mathbf{r} \in \mathcal{P}_n} \exp\{-\frac{\alpha^0}{n} d(\mathbf{r}, \boldsymbol{\rho}^0)\}}$
- $P(\boldsymbol{\rho} | \mathbf{R}^1, \dots, \mathbf{R}^N, \alpha^o)$ : Mallows posterior
- $\{i_1, \dots, i_n\}$ : a ranking of  $n$  items that determines the sequence following which the items are to be sampled. i.e.  $i_j = k$  indicates that item  $j$  is the  $k$ -th item is to be sampled
- $\{o_1, \dots, o_n\}$ : an ordering of  $n$  items that corresponds to  $\{i_1, \dots, i_n\}$  s.t.  $i_{o_k} = k$ .  $\{o_1, \dots, o_n\}$  and  $\{i_1, \dots, i_n\}$  have a one-to-one relationship
- $Q(\tilde{\boldsymbol{\rho}} | \cdot) = \sum_{\{i_1, \dots, i_n\} \in \mathcal{P}_n} q(\tilde{\boldsymbol{\rho}} | i_1, \dots, i_n, \alpha_0, \mathbf{R}^1, \dots, \mathbf{R}^N) \cdot g(i_1, \dots, i_n | \dots)$  : pseudolikelihood that approximates the Mallows posterior
- $q(\tilde{\boldsymbol{\rho}} | i_1, \dots, i_n, \alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N) = q(\tilde{\boldsymbol{\rho}} | o_1, \dots, o_n, \alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N)$   
 $= q(\tilde{\rho}_{o_1} | \alpha^0, o_1, R_{o_1}^1, \dots, R_{o_1}^N) \cdot q(\tilde{\rho}_{o_2} | \alpha^0, o_2, \tilde{\rho}_{o_1}, R_{o_2}^1, \dots, R_{o_2}^N) \cdot \dots \cdot$   
 $q(\tilde{\rho}_{o_{n-1}} | \alpha^0, o_{n-1}, \tilde{\rho}_{o_1}, \dots, \tilde{\rho}_{o_{n-2}}, R_{o_{n-1}}^1, \dots, R_{o_{n-1}}^N) \cdot q(\tilde{\rho}_{o_n} | \alpha^0, o_n, \tilde{\rho}_{o_1}, \dots, \tilde{\rho}_{o_{n-1}}, R_n^1, \dots, R_n^N)$   
 $= \frac{\exp\{-\frac{\alpha_0}{n} \sum_{j=1}^N d(R_{o_1}^j, \tilde{\rho}_{o_1})\} \mathbb{1}_{\tilde{\rho}_{o_1} \in \{1, \dots, n\}}}{\sum_{\tilde{r}_{o_1} \in \{1, \dots, n\}} \exp\{-\frac{\alpha_0}{n} \sum_{j=1}^N d(R_{o_1}^j, \tilde{r}_{o_1})\}}$

$$- q(\tilde{\rho}_{o_k} | \alpha^0, o_k, \tilde{\rho}_{o_1}, \dots, \tilde{\rho}_{o_{k-1}}, R_{o_k}^1, \dots, R_{o_k}^N) = \frac{\exp\{-\frac{\alpha_0}{n} \sum_{j=1}^N d(R_{o_k}^j, \tilde{\rho}_{o_k})\} \mathbb{1}_{\tilde{\rho}_{o_k} \in \{1, \dots, n\} \setminus \{\tilde{\rho}_{o_1}, \dots, \tilde{\rho}_{o_{k-1}}\}}}{\sum_{\tilde{r}_{o_k} \in \{1, \dots, n\} \setminus \{\tilde{\rho}_{o_1}, \dots, \tilde{\rho}_{o_{k-1}}\}} \exp\{-\frac{\alpha_0}{n} \sum_{j=1}^N d(R_{o_k}^j, \tilde{r}_{o_k})\}}$$

for  $k = 2, \dots, n$

- $\mathbf{o}^0$ : a set of ordering that corresponds to  $\boldsymbol{\rho}^0$  s.t.  $\rho^{0^{-1}}(m) = o_m^0$
- Define the “v-function”  $f_v(\cdot)$  such that  $f_v(\boldsymbol{\rho}^0) = \mathcal{V}_{\boldsymbol{\rho}^0}$ , where

$$- \mathcal{V}_{\boldsymbol{\rho}^0} = \begin{cases} \{\mathbf{r} \in \mathcal{P}_n : r_{o_m^0} = 1, r_{o_{m \pm k}^0} \in \{2k, 2k+1\}, k = 1, \dots, m-1\}, & \text{if } n \text{ is odd} \\ \{\mathbf{r} \in \mathcal{P}_n : \{r_{o_{m-k}^0}, r_{o_{m+k+1}^0}\} \in \{2k+1, 2k+2\}, k = 0, \dots, m\}, & \text{if } n \text{ is even} \end{cases}$$

## 2 Theorems and Lemmas

### 2.1

**Lemma 2.1.1** *Given there are odd number of items, i.e.  $n = 2m - 1$ .  $\forall \alpha^0 \in (0, \infty)$ ,*

1.  $\mathbb{E}(R_{o_m^0} | \boldsymbol{\rho}^0, \alpha^0) = \rho_{o_m^0}^0 = m$
2.  $\forall j \in [1, m-2], j < \mathbb{E}[R_{o_j^0} | \boldsymbol{\rho}^0, \alpha^0] < \mathbb{E}[R_{o_{j+1}^0} | \boldsymbol{\rho}^0, \alpha^0] < m$
3.  $\forall j \in [m+2, 2m-1], m < \mathbb{E}[R_{o_{j-1}^0} | \boldsymbol{\rho}^0, \alpha^0] < \mathbb{E}[R_{o_j^0} | \boldsymbol{\rho}^0, \alpha^0] < j$

*Similarly, if  $n$  is even, i.e.  $n = 2m$ ,  $\forall \alpha^0 \in (0, \infty)$ ,*

1.  $\forall j \in [1, m-1], j < \mathbb{E}[R_{o_j^0} | \boldsymbol{\rho}^0, \alpha^0] < \mathbb{E}[R_{o_{j+1}^0} | \boldsymbol{\rho}^0, \alpha^0]$
2.  $\forall j \in [m+2, 2m], \mathbb{E}[R_{o_{j-1}^0} | \boldsymbol{\rho}^0, \alpha^0] < \mathbb{E}[R_{o_j^0} | \boldsymbol{\rho}^0, \alpha^0] < j$

*Note that for both cases, it satisfies that  $\forall 1 \leq j < k \leq n$  and  $\forall \alpha > 0$ ,  $\mathbb{E}[R_{o_j^0} | \boldsymbol{\rho}^0, \alpha^0] < \mathbb{E}[R_{o_k^0} | \boldsymbol{\rho}^0, \alpha^0]$*

**Lemma 2.1.2** *As  $N \rightarrow \infty$ ,  $\frac{1}{N} \sum_{j=1}^N R_i^j \rightarrow \mathbb{E}[R_i | \boldsymbol{\rho}^0, \alpha^0]$ ,  $\forall i = 1, \dots, n$*

**Definition 1** *Given a vector of length  $n$ , i.e.  $\{x_1, \dots, x_n\}$ , the function  $\text{rank}(x_1, \dots, x_n)$  is defined as  $\text{rank}(x_1, \dots, x_n) = \{r_1, \dots, r_n\}$  such that  $x_{(r_k)} = x_k$ ,  $\forall k = 1, \dots, n$*

**Theorem 2.1.3** *As  $N \rightarrow \infty$ , and  $\forall \alpha > 0$ ,*

$$\text{rank}(\frac{1}{N} \sum_{j=0}^N R_1^j, \dots, \frac{1}{N} \sum_{j=0}^N R_n^j) \rightarrow \text{rank}(\mathbb{E}[R_1 | \boldsymbol{\rho}^0, \alpha_0], \dots, \mathbb{E}[R_n | \boldsymbol{\rho}^0, \alpha_0]) = \boldsymbol{\rho}^0$$

To rephrase, as  $N$  approaches infinity, the Mallows consensus parameter  $\boldsymbol{\rho}^0$  can be inferred from the data by taking the marginal mean for each item and then apply the rank function

to these marginal means.

## 2.2

**Theorem 2.2.1** For a function  $g$  defined on  $\mathcal{P}_n$  which can depend on  $\boldsymbol{\rho}^0$ , for any  $n$ ,

$$\begin{aligned} & \arg \min_{g \in \mathcal{D}_{\boldsymbol{\rho}^0}} \lim_{N \rightarrow \infty} KL(P(\boldsymbol{\rho}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N) || \sum_{\{i_1, \dots, i_n\} \in \mathcal{P}_n} q(\tilde{\boldsymbol{\rho}}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N, i_1, \dots, i_n) g(i_1, \dots, i_n | \boldsymbol{\rho}^0)) \\ & = g^*(i_1, \dots, i_n | \mathcal{V}_{\boldsymbol{\rho}^0}), \\ & \text{where} \end{aligned}$$

- $\mathcal{D}_{\boldsymbol{\rho}^0}$  is the set of all distributions on  $\mathcal{P}_n$ , which can depend on  $\boldsymbol{\rho}^0$
- $g^*(i_1, \dots, i_n | \mathcal{V}_{\boldsymbol{\rho}^0})$  is a distribution whose density is concentrated on  $\boldsymbol{\rho}^0$ , defined as
$$\begin{cases} g^*(i_1, \dots, i_n | \mathcal{V}_{\boldsymbol{\rho}^0}) = |\mathcal{V}_{\boldsymbol{\rho}^0}|^{-1} > 0, & \text{if } \{i_1, \dots, i_n\} \in \mathcal{V}_{\boldsymbol{\rho}^0} \\ g^*(i_1, \dots, i_n | \mathcal{V}_{\boldsymbol{\rho}^0}) = 0, & \text{if } \{i_1, \dots, i_n\} \notin \mathcal{V}_{\boldsymbol{\rho}^0} \end{cases}, \text{ where } |\mathcal{V}_{\boldsymbol{\rho}^0}| = \begin{cases} 2^{m-1}, & \text{if } n \text{ is odd} \\ 2^m, & \text{otherwise} \end{cases}$$

That is to say, for a set of distributions  $g$ , which are defined on the space of permutation of  $n$  items  $\mathcal{P}_n$ , as the number of users  $N \rightarrow \infty$ , the distribution  $g^*$  that minimizes the KL-divergence between the Mallows posterior and the pseudolikelihood defined above, is a uniform distribution with its density concentrated on  $\mathcal{V}_{\boldsymbol{\rho}^0}$

## 2.3

For a given  $N < \infty$ , define  $\hat{\boldsymbol{\rho}}^0$  as  $\text{rank}(\frac{1}{N} \sum_{j=0}^N R_1^j, \dots, \frac{1}{N} \sum_{j=0}^N R_n^j)$  and  $\mathcal{V}_{\hat{\boldsymbol{\rho}}^0} = f_v(\hat{\boldsymbol{\rho}}^0)$ .

**Theorem 2.3.1**  $\exists \sigma \geq 0$  and  $g'(i_1, \dots, i_n | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0}, \sigma)$  such that

$$\begin{aligned} & KL(P(\boldsymbol{\rho}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N) || \sum_{\{i_1, \dots, i_n\} \in \mathcal{P}_n} q(\tilde{\boldsymbol{\rho}}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N, i_1, \dots, i_n) g^*(i_1, \dots, i_n | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0})) \geq \\ & KL(P(\boldsymbol{\rho}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N) || \sum_{\{i_1, \dots, i_n\} \in \mathcal{P}_n} q(\tilde{\boldsymbol{\rho}}|\alpha^0, \mathbf{R}^1, \dots, \mathbf{R}^N, i_1, \dots, i_n) g'(i_1, \dots, i_n | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0}, \sigma)) \end{aligned}$$

where  $g'(i_1, \dots, i_n | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0}, \sigma) = \sum_{\hat{\mathbf{v}} \in \mathcal{V}_{\hat{\boldsymbol{\rho}}^0}} \{g^*(\hat{\mathbf{v}} | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0}) \int_{\mathbf{x}} \mathcal{F}_r(i_1, \dots, i_n | x_1, \dots, x_n) \prod_{i=1}^n \mathcal{N}(x_i | \hat{v}_i, \sigma) d\mathbf{x}\}$ , and

- $\hat{\mathbf{v}} \sim g^*(\hat{\mathbf{v}} | \mathcal{V}_{\hat{\boldsymbol{\rho}}^0})$
- $x_i \sim \mathcal{N}(x_i | \hat{v}_i, \sigma)$  for  $i = 1, \dots, n$
- $i_1, \dots, i_n \sim \mathcal{F}_r(i_1, \dots, i_n | x_1, \dots, x_n)$ , where  $\mathcal{F}_r = \begin{cases} 1, & \text{if } \{i_1, \dots, i_n\} = \text{rank}(x_1, \dots, x_n) \\ 0, & \text{otherwise} \end{cases}$

As  $N$  is limited,  $\boldsymbol{\rho}^0$  and therefore,  $\mathcal{V}_{\boldsymbol{\rho}^0}$  usually cannot be accurately inferred from the data. We can however, sample for  $i_1, \dots, i_n$  by sampling for each item  $i$  from a univariate Gaussian

distribution centered on  $\hat{v}_i$  with a fixed variance  $\sigma$  for all items, and then obtain a ranking using the rank function. By introducing the variance, a smaller KL divergence from the Mallows posterior can be achieved.

## 2.4

**Theorem 2.4.1** *With the usage of  $g'(i_1, \dots, i_n | \mathcal{V}_{\hat{\rho}^0}, \sigma)$ , the value of  $\sigma$  that minimizes the KL-divergence between the Mallows posterior and the resulted pseudolikelihood is*

$$\sigma = \begin{cases} 0, & \text{if } \delta(\alpha^0, n, N) \leq \delta^* \\ f(\alpha^0, n, N), & \text{otherwise} \end{cases}$$

In other words,  $\sigma$  should be 0 when  $\delta(\alpha^0, n, N) \geq \delta^*$ . Beyond this point, the optimal choice of  $\sigma$  should be greater than 0, and it follows a function  $f(\alpha^0, n, N)$ .

## 2.5

**Theorem 2.5.1** *As  $N \rightarrow \infty, \sigma = 0 \forall \alpha > 0$  and  $n \geq 1$*

# 3 Evidence and proofs

## 3.1 Evidence for Theorem 2.3.1

In **Figure 3.2.1**, for each subfigure, we calculate and plot the KL-divergences between the Mallows posterior and the pseudo-likelihood, computed with different choices of  $\sigma$ . The left-most point on each sub-figure corresponds to the KL-divergence when no Gaussian variation is introduced, i.e.  $\sigma = 0$ . It can be observed that for most situations shown in the figure, the lowest KL-divergence is achieved when some level of Gaussian variation is introduced, especially as  $N$  and  $\alpha^0$  are relatively small. However, as  $N$  and  $\alpha^0$  increase, the optimal  $\sigma$  appears to decrease towards 0.

## 3.2 Evidence for Theorem 2.4.1

### 3.2.1 Optimal $\sigma$ is determined by $N, n, \alpha^0$

As shown in **Figure 3.2.1**, in each subfigure, the  $\sigma$  value that corresponds to the lowest KL-divergence is the optimal  $\sigma$  for its specific  $(N, n, \alpha^0)$  set up. Each row of 3 figures shows a comparison of the optimal  $\sigma$  when one of the variables  $(N, n, \alpha)$  changes. It can be observed that all three variables have an impact on the optimal value of  $\sigma$ . More specifically, the optimal choice of  $\sigma$  appear to decrease as  $N$  and  $\alpha^0$  increase, and as  $n$  decreases.

For each  $N, n$  and  $\alpha^0$ , we simulate 10 datasets, and for each dataset, a grid of  $\sigma$  values are tried out. In **Figure 3.2.1**, we plot  $\alpha^0$  on the x-axis, and its corresponded optimal

(a)

(b)

(c)

Figure 1: x-axis:  $\sigma$ , y-axis: KL-divergence

$\sigma$  on the y-axis. It can be observed that when  $\alpha^0$  and  $N$  are large, and  $n$  is small, all

$\sigma$  values result in small KL-divergence. To simplify, in these situations, we can safely set  $\sigma = 0$  to achieve small KL-divergence. As  $N$  and  $\alpha^0$  decreases and as  $n$  increases, optimal  $\sigma$  increases.

(a)

(b)

Figure 2: x-axis:  $\alpha^0$ , y-axis: optimal  $\sigma$

### 3.3 using data standard deviation / n as a proxy for $\alpha^0$

Under most situations, the value of  $\alpha^0$  is unknown, however, we can compute the marginal standard deviation of each item from the data, and normalize it by deviding it by n. The trend demonstrated in **Figure 3.2.1** is well-preserved, as shown in **Figure 3.3**.
